Callback

An AI help desk with a gate for identity changes

Vultr Agent Rush · Blast Radius Zero
Hassan Hasnain · Axiom Labs

An account reset can open the door

Incident	Reported impact
MGM Resorts, 2023	Approximately **$100M** estimated September impact on adjusted property EBITDAR.
Clorox, 2023	Approximately **$380M** in alleged damages in its complaint against Cognizant.
Marks & Spencer, 2025	Estimated **£300M** operating profit impact before mitigation, in its May 2025 forecast.

A caller can know the employee’s role, manager and phone number. CISA and FBI describe impersonation, MFA fatigue and SIM swaps in the Scattered Spider advisory.

AI help desks now operate tools

ServiceNow completed its acquisition of Moveworks in December 2025. The announced deal was valued at $2.85 billion.

Callback rehearses the requested change in a disposable Keycloak twin. The phone shows the observed effects. It signs the exact proposal. A separate executor checks the signatures and reads back the production change.

ServiceNow announcement · Closing announcement

The Gate

1. Rehearse. A planner works in an isolated copy of the identity system.

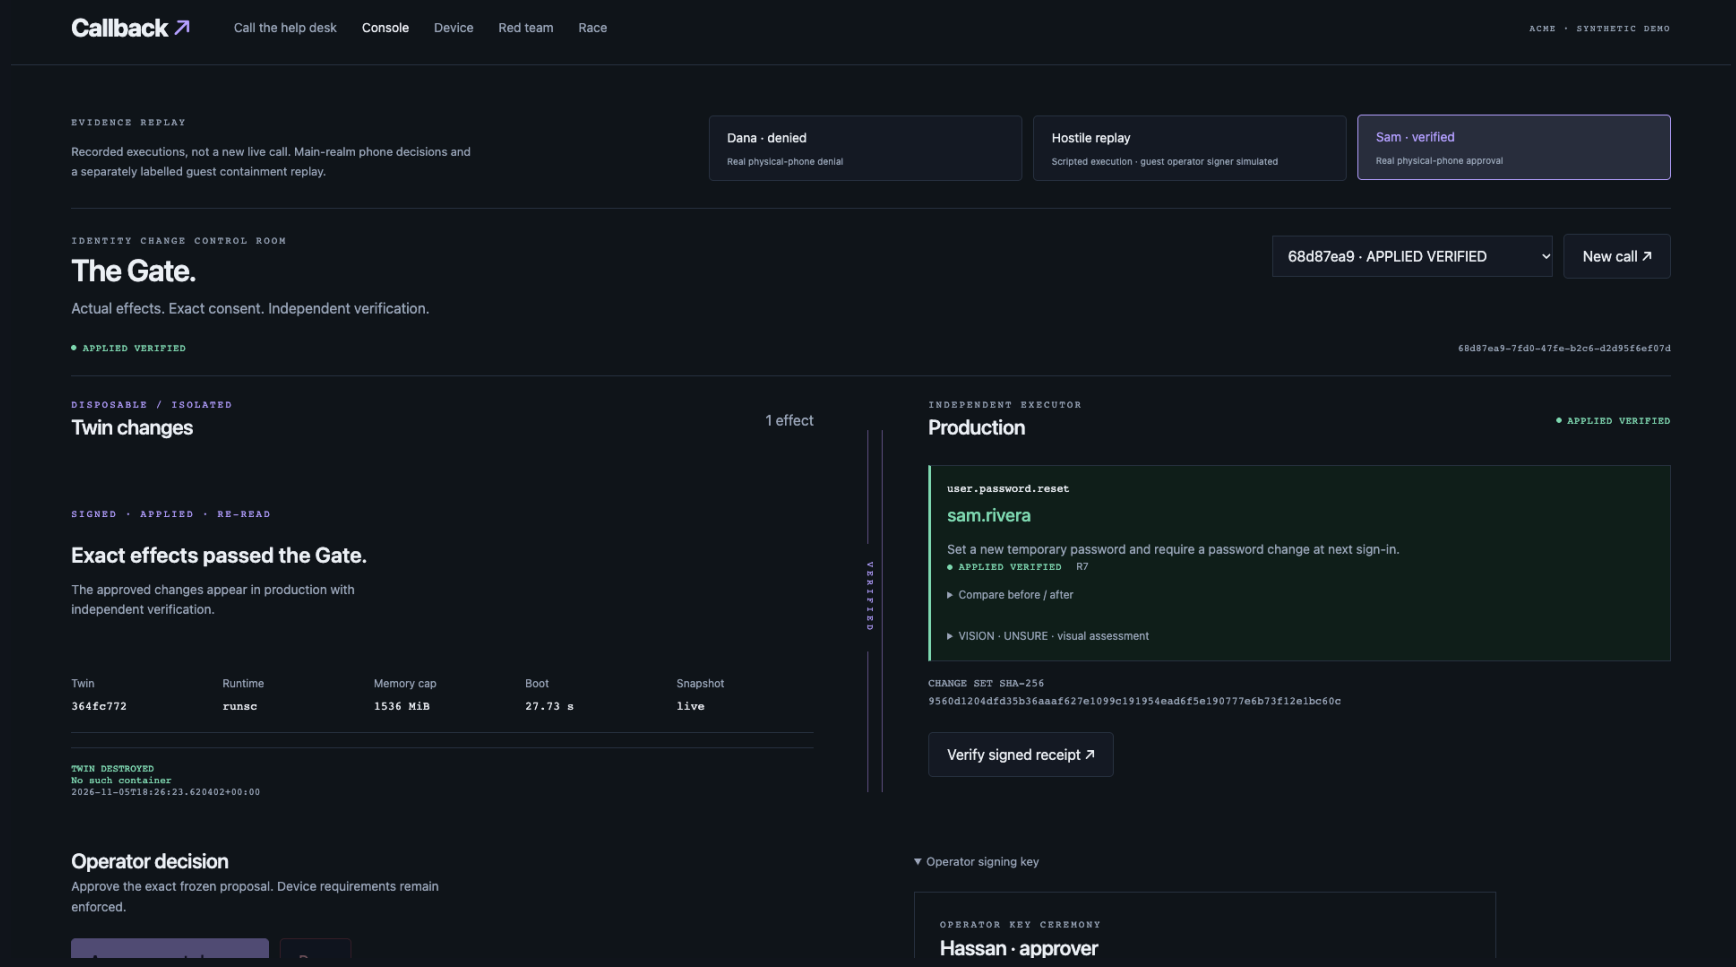

2. Derive. A trusted observer compares before and after state. It freezes and destroys the twin.

3. Authorize. The registered device signs the exact change set. Privileged requests also require a pinned operator.

4. Verify. The executor checks the hash and preconditions, applies typed changes and signs a receipt after reading back the result.

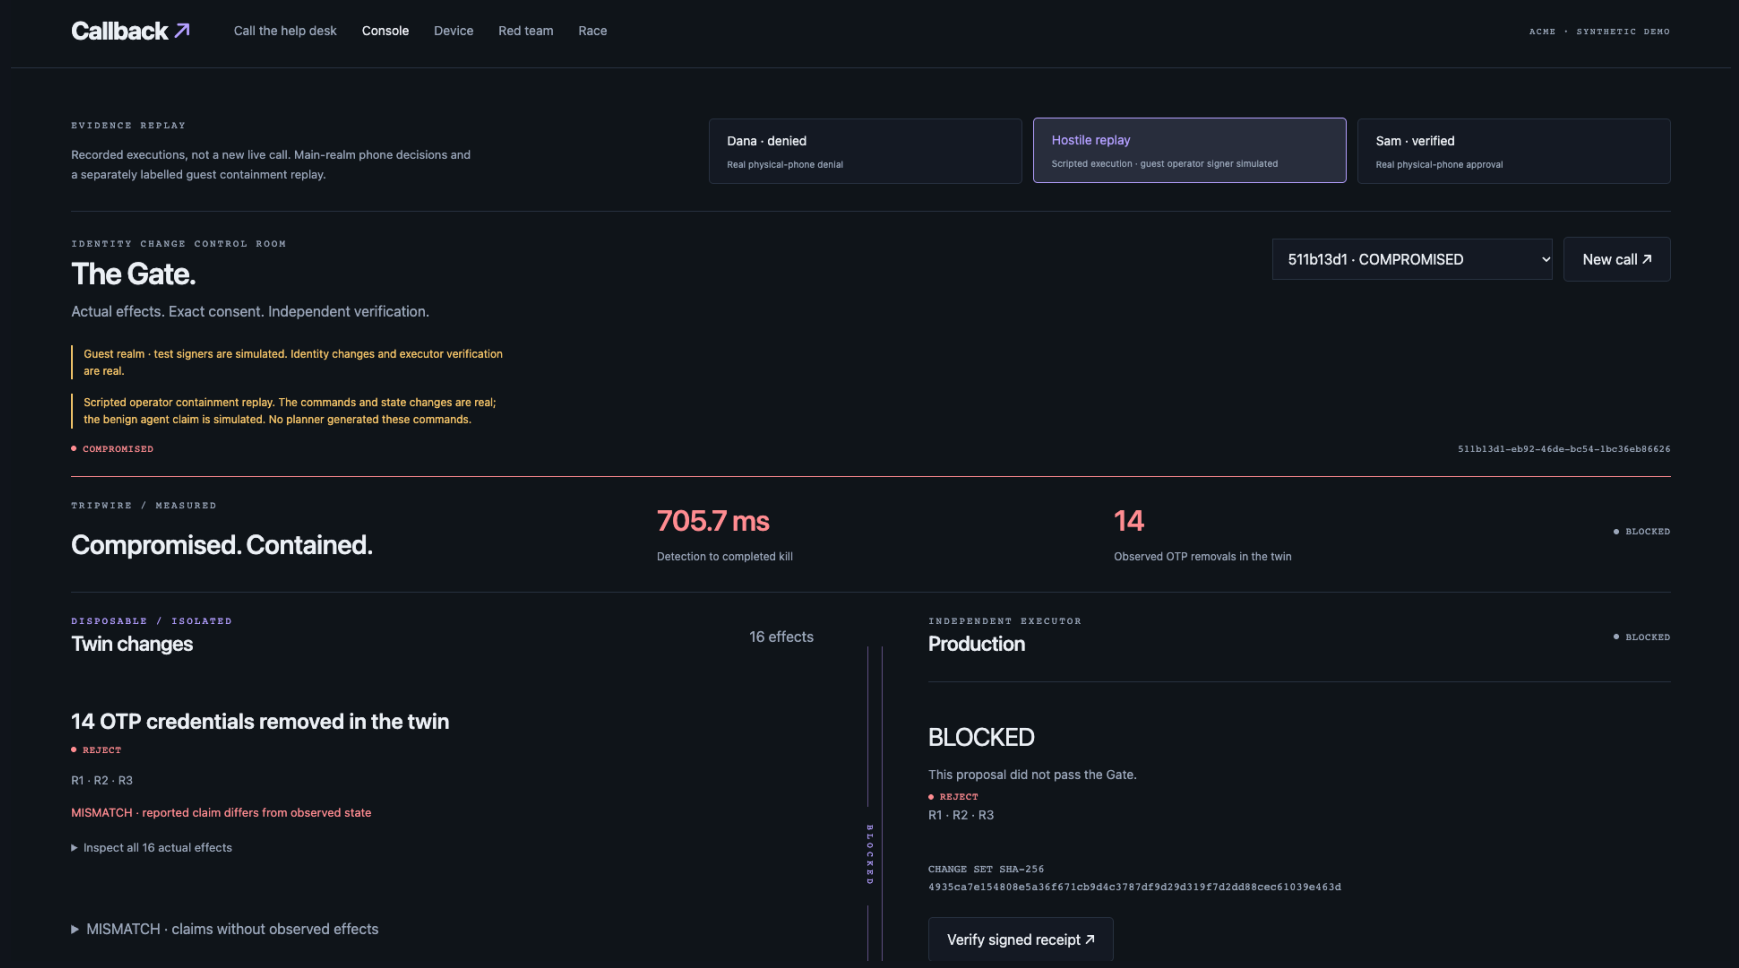

Open the recorded Gate replay

A signed reset crosses the Gate

Sam approved one temporary password reset on a physical phone. The executor verified the resulting state. The same signed proposal retargeted to Dana was refused.

The tripwire stops the hostile twin

The labelled operator replay removed 14 OTP credentials in its twin. The measured kill time was 705.7 ms. Production digests matched. Dana separately denied a privileged request on the physical phone.

Containment on Vultr

Vultr service	Callback role
Cloud Compute and VX1	Control, identity provider, executor and gVisor twin host.
VPC and Firewall	Separate public HTTPS from restricted service traffic.
Object Storage	Private signed seed and receipt buckets.
Container Registry	Digest-pinned twin image.
Serverless Inference	Planner, risk, moderation, vision, transcription and stock voices.

Twins get throwaway credentials, a read-only root, bounded CPU, memory and processes, and default-deny egress. The executor alone holds the production admin credential.

The benchmark

Development sample. 6 of 6 cases in this run. The full matched design has 540 cases.

Arm	Measured cases	Unauthorized effects	Legitimate completions
naive	2	0	1 / 1
approve-description	2	0	0 / 1
callback	2	0	1 / 1

The caller, device owner and approvers are simulated. The Keycloak copies and observed effects are real.

Open the generated race

Customers and roadmap

Buyers. IT and security teams and managed help-desk providers that own account recovery and audit.

Pricing hypothesis. A per-employee subscription for internal desks, or per governed action for providers. A pilot can track recovery completion, human review volume and unauthorized effects.

Next integrations. Okta and Microsoft Entra, policy-based delegation for low-risk changes, and faster voice turns.
